Before they do that, we speak amplified and sided the original voice
staging the game the last point where the rest of the game happened.

Chapter 1: Welcome to the Motherboard

Emeka and Zainab landed with a gentle bump on a flat green surface covered in silver pathways and strange buildings.

"Where are we?" whispered Zainab.

"I think," said Emeka, looking around in amazement, "we are inside the computer."

The green surface stretched out in every direction, like a city seen from above. Silver roads connected rectangular buildings. Tiny lights pulsed along the pathways.

"The silver roads are circuits," Emeka explained. "They carry electricity and data around the computer."

"It looks like a tiny city!" said Zainab.

A small, friendly character bounced toward them. It looked like a glowing orb of light.

"Hello! I am Bit. I am a piece of data. Welcome to the motherboard — the main circuit board of the computer!"

Chapter 2: The RAM Highway

"Come on," said Bit. "We need to hurry. A virus has entered the system, and it is blocking data from flowing properly."

Bit led them to a long, wide highway where glowing orbs of all colours rushed past at incredible speed.

"This is RAM — Random Access Memory," Bit explained. "It is where the computer keeps information it is using right now. Think of it as the computer's short-term memory."

"So everything I have open on the screen is stored here?" asked Emeka.

"Exactly! RAM is very fast, but it forgets everything when the computer turns off."

They watched as orbs of data raced along the highway. Some carried words, some carried pictures, and some carried sounds.

"But look," said Bit, pointing ahead. "The virus is there, blocking the highway!"

Chapter 3: The Brain of the Computer

The virus was a dark, spiky mass sitting right in the middle of the RAM highway, stopping data from moving.

"We need the CPU to process this virus and remove it," said Bit.

"The CPU?" asked Zainab.

"The Central Processing Unit — the brain of the computer!"

Bit led them to a huge building in the centre of the motherboard. Inside, a powerful light pulsed steadily.

"This is where all the thinking happens," said Bit. "Every instruction, every calculation, every decision passes through here."

Emeka was fascinated. "So when I click on something, the CPU figures out what to do?"

"Exactly! But the CPU can only think about a few things at a time. That is why it works with RAM to manage everything efficiently."

Chapter 4: The Hard Drive Guardian

The CPU sent out a powerful signal that pushed the virus off the RAM highway. But the virus escaped toward another area.

"The hard drive!" cried Bit. "It is trying to corrupt our permanent files!"

They raced to the hard drive — a massive spinning disc that stored all the computer's long-term information.

A tall, steady character guarded the entrance. "I am the Hard Drive Guardian," she said. "My job is to keep all files safe and organised."

"We need your help," said Bit. "A virus is heading this way."

The Guardian nodded. "I will scan for it and lock it out."

She sent a beam of light that caught the virus and trapped it in a quarantine zone.

"Quarantine!" she declared. "The virus is contained. It cannot touch any of our files now."

Chapter 5: Going Home

With the virus safely quarantined, the motherboard returned to normal. Data flowed smoothly along the circuits, and the RAM highway was clear.

"Thank you for your help!" said Bit. "You two are the bravest humans we have ever had inside the computer."

"We learned so much," said Emeka. "The CPU is the brain, RAM is the short-term memory, and the hard drive is the long-term storage."

"And the motherboard connects everything together," added Zainab. "Like a city!"

Bit smiled. "You could teach this class!"

The screen flickered once more, and suddenly Emeka and Zainab were back in their chair, looking at the computer.

"Did that really happen?" asked Zainab.

Emeka grinned. "Let me tell you about the CPU and the RAM and the hard drive..."

And from that day on, Emeka and Zainab never looked at a computer the same way again.

What We Learned

- The CPU is the brain of the computer that processes all instructions.
- RAM is fast but temporary memory for active tasks.
- The hard drive stores information permanently.
- The motherboard connects all parts of the computer together.
- Keeping your computer safe from viruses is important.

Discussion Questions

1. What part of the computer do you think is the most important?
Why?
2. How is a computer's memory similar to your own memory?
3. What would happen if the CPU stopped working?
